nervous system depression and chemical pneumonitis resulting from aspiration into the lungs following ingestion.

**Hexane - Chronic:**

Dermal irritation and central nervous system depression accompanied by peripheral nervous system damage (polyneuropathy) are common traits of sustained overexposure.

**Methyl Acetate:**

Breathing small amounts of methyl acetate during normal handling may cause irritation to the mucous membranes of the nose, throat and lungs. Excessive inhalation can cause central nervous system depression which could include dizziness, drowsiness, weakness, fatigue, nausea, headache and unconsciousness. Methyl acetate is a moderate eye irritant and can cause stinging, redness and swelling of the eyes. It is also a skin irritant and prolonged contact will result in defatting and redness of the skin which could lead to dermatitis. Ingestion of methyl acetate can cause nausea, vomiting, and diarrhea.

**Acetone - Acute:**

Acetone has a low order of acute and inhalation toxicity. Acetone is a slight skin irritant and moderately severe eye irritant. Excessive inhalation can cause headache, drunkenness, and weakness.

**Acetone - Chronic:**

Kidney damage and anemia can result from sustained high level exposure. Acetone is reported to potentate the liver toxicity of chloroform.
